

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions and listings of claims in the application:

1. - 7. (Canceled).

8. (Currently Amended) A server apparatus comprising:
a network process unit configured to connect an electronic apparatus, which transmits/receives data via a first network, to a second network through the server apparatus; and
an AV function unit configured to process video data and sound data;
the network process unit returning a communication packet containing a command indicating a current status of the AV function unit, when the network process unit receives, from the electronic apparatus, a communication packet containing a command to check the current status of the AV function unit, and
switching an operation of the AV function unit between a normal operation mode and a standby mode serving to reduce power consumption, when the network process unit receives, from the electronic apparatus, a communication packet containing a command requesting that the operation of the AV function unit be changed.

9. (Previously Presented) The server apparatus according to claim 8, wherein, upon switching of operation of the AV function unit, the network process

unit notifies the electronic apparatus that the operation of the AV function unit has been switched.

10. - 13. (Canceled).

14. (Currently Amended) A server apparatus comprising:

a network process unit configured to connect an electronic apparatus, which transmits/receives data via a first network, to a second network through the server apparatus; and

an AV function unit configured to process video data and sound data, the network process unit including:

a detecting unit configured to detect a power supply control packet in communication packets sent from the electronic apparatus, the power supply control packet containing one of a status check command to check the current status of the AV function unit, a power-on command for causing the AV function unit to recover from a standby mode serving to reduce power consumption [[or]] and a power supply standby command for causing the AV function unit to shift to the standby mode; and

a controlling unit configured to return a communication packet containing a command indicating a current status of the AV function unit, when the detecting unit detects the power supply control packet containing the status check command, and to cause the AV function unit to recover from or shift to the standby mode, when the detecting unit detects the power supply control packet containing the power-on command or the power supply standby command.

15. (Previously Presented) The server apparatus according to claim 14,
further comprising:

an embedded controller configured to control power supply to the AV
function unit for interrupting the power supply; and

an up/down signal line which is arranged between the network
process unit and the embedded controller,

the controlling unit of the network process unit outputting an up/down
signal providing an instruction to supply power to the AV function unit or to interrupt
the power supply on the up/down signal line.

16. (Previously Presented) The server apparatus according to claim 15,
further comprising:

a status signal line which is arranged between the network process
unit and the embedded controller,

the embedded controller being configured to output a status signal
indicating a status of the AV function unit on the status signal line.
